

## DC parameters:

### Strong inversion:

$$V_{dss} = \frac{V_{gs} - V_t}{n}$$

$$V_t = V_t(V_{sb} = 0) + (n_0 - 1)V_{sb}$$

$$n \sim n_0 \sim 1 + 33 / \mathbf{m}_0 C_{ox}, \text{ with } \mathbf{m}_0 C_{ox} \text{ in } \mu\text{A}/\text{V}^2$$

$$\mathbf{b} = \mathbf{m}_0 C_{ox} W / L$$

( $C_{ox}$  = gate oxide capacitance,  $W$  = transistor width,  $L$  = transistor length,  $\mathbf{m}_0$  = electron mobility)

$$I_D = \frac{\mathbf{b}}{2n} \cdot (V_{gs} - V_t)^2$$

for  $V_{ds} > V_{dss}$  (MOST in saturation)

$$I_D = \mathbf{b} \cdot ((V_{gs} - V_t) \cdot V_{ds})$$

for  $V_{ds} < V_{dss}$ .

### Weak inversion:

$$V_{gs} \sim V_t + 5U_T$$

$$V_{dss} = 5U_T$$

$$V_t = V_t(V_{sb} = 0) + (n_0 - 1)V_{sb}$$

$$n \sim n_0 \sim 1 + 33 / \mathbf{m}_0 C_{ox}, \text{ with } \mathbf{m}_0 C_{ox} \text{ in } \mu\text{A}/\text{V}^2$$

### Matching:

$$\mathbf{s}(\Delta V_t) \approx K / \sqrt{LW}$$

$$\mathbf{s}(\Delta \mathbf{b} / \mathbf{b}) \approx N \sqrt{(1/L^2) + (1/W^2)}$$

$$\mathbf{s}\left(\frac{\Delta I_D}{I_D}\right) \approx \sqrt{\mathbf{s}(\Delta \mathbf{b} / \mathbf{b})^2 + \frac{g_m}{I_D} \cdot \mathbf{s}(\Delta V_t)^2}$$

$$\mathbf{s}(\Delta V_t) \approx \sqrt{\frac{I_D}{g_m} \cdot \mathbf{s}(\Delta \mathbf{b} / \mathbf{b})^2 + \mathbf{s}(\Delta V_t)^2}$$

$K_n \sim 16 \text{ mV} \cdot \mu\text{m}$ ,  $N_n \sim 1.6\text{E-}2 \mu\text{m}$  (index  $n$  = NMOS)

$K_p \sim 31 \text{ mV} \cdot \mu\text{m}$ ,  $N_p \sim 2.4\text{E-}3 \mu\text{m}$  (index  $p$  = PMOS)

## AC parameters:

### strong, weak and moderate inversion, $V_{ds} > V_{dss}$

$$I_{D\text{lim}} = \frac{\mathbf{b}}{2n} (2nU_T)^2$$

$$\text{LIM} = I_D / I_{D\text{lim}}$$

$$g_m = \frac{I_D}{nU_T \sqrt{1 + \text{LIM}}}$$

$$g_{ms} = g_m \cdot n$$

$$V_{\text{early}} = L \mathbf{m}_0 C_{ox} / X, \text{ where } X = 10 \sim 8 \text{ V}^3 / \mu\text{A}.$$

$$g_{ds} = I_D / V_{\text{early}}$$

$$C_{gd} = C_{ox} \cdot W \cdot L_d, \text{ , } L_d = \text{length of the drain-gate overlap}$$

$$C_{gs} = C_{ox} \cdot W \cdot L_s + 2 \cdot C_{ox} \cdot W \cdot L / (3 \cdot n) \text{ (} L_s = \text{length of the source-gate overlap), weak inversion.}$$

$$C_{gs} = C_{ox} \cdot W \cdot L_s + 2 \cdot C_{ox} \cdot W \cdot L / 3 \text{ (} L_s = \text{length of the source-gate overlap), strong inversion.}$$

Use for moderate inversion the average  $C_{gs}$  value

$$C_{db} = C_j \cdot A_d \frac{1}{(1 + V_{db} / P_B)^{M_j}} + C_{jsw} \cdot P_d \frac{1}{(1 + V_{db} / P_B)^{M_{jsw}}}$$

$$C_{sb} = C_j \cdot A_s \frac{1}{(1 + V_{sb} / P_B)^{M_j}} + C_{jsw} \cdot P_s \frac{1}{(1 + V_{sb} / P_B)^{M_{jsw}}}$$

$$\frac{-2}{v_n(f)}$$

$$v_n(f) = 4 \cdot n \cdot k \cdot T / (2 \cdot g_m) + K / (W \cdot L \cdot f), \text{ weak inversion}$$

$$\frac{-2}{v_n(f)}$$

$$v_n(f) = 8 \cdot k \cdot T / (3 \cdot g_m) + K / (W \cdot L \cdot f), \text{ strong inversion}$$

Use for moderate inversion the average  $v_n(f)$  value.
